Introduction

The moduli
spaces of
ppav's

The Shimura
varieties

The Shimura curve
The Shimura
surface

Example of a **Shimura variety**:

a moduli space of ppav's with an automorphism,
i.e. of triples (X, L, ϕ) :

- X a complex torus ($X \cong V/\Gamma$),
- L ample line bundle on X , which gives a principal polarization (equiv: $h^0(L) = 1$),
- ϕ is an automorphism of (X, L) :

$$\phi : X \xrightarrow{\cong} X, \quad \phi(0) = 0, \quad \phi^*L \sim L.$$

$A_{g,*}$: Moduli space of ppav's with level structure $*$

(for example, $*$ = level n : $\alpha : A[n] \xrightarrow{\cong} (\mathbb{Z}/n\mathbb{Z})^{2g}$)

which is a Galois cover with group G of A_g :

$$A_{g,*} \longrightarrow A_g = A_{g,*}/G.$$

Shimura variety as fixed point set

Introduction

The moduli
spaces of
ppav's

The Shimura
varieties

The Shimura curve
The Shimura
surface

Given (X, L, ϕ) and a point $[(X, L, \alpha)] \in A_{g,*}$ then

- define $\phi^*[(X, L, \alpha)] = [(X, L, \alpha \circ \phi)]$,
- you get $\phi^* \in G$, (more precisely: $\alpha \circ \phi^* \circ \alpha^{-1} \in G$)
- $[(X, L, \alpha)] = [(X, L, \alpha \circ \phi)]$ (isomorphic objects), so $[(X, L, \alpha)]$ is a *fixed point* for $\phi^* \in G$ in $A_{g,*}$

Hence: moduli space of triples (X, L, ϕ) ,

with level structure $*$,

is the fixed point locus $(A_{g,*})^{\phi^*}$, a **Shimura variety**.

The Shimura
varieties

The Shimura curve
The Shimura
surface

Given a G -equivariant embedding

$$\Theta : A_{g,*} \longrightarrow \mathbb{P}^N, \quad \Theta \circ g = M_g \circ \Theta,$$

for $g \in G$, $M_g \in \text{Aut}(\mathbb{P}^N)$,

the image of the moduli space of triples (X, L, ϕ)
with level structure $*$ is

$$\Theta((A_{g,*})^{\phi*}) = \Theta(A_{g,*}) \cap \mathbb{P}_\lambda$$

where \mathbb{P}_λ is an eigenspace of M_g .

ppav's

The Shimura
varieties

The Shimura curve
The Shimura
surface

To do:

- specify the triples (A, L, ϕ) ,
- specify level structure $*$,
- find G -equivariant map $\Theta : A_{g,*} \longrightarrow \mathbb{P}^N$,
- determine $M_{\phi^*} \in \text{Aut}(\mathbb{P}^N)$ and its eigenspaces \mathbb{P}_λ ,
- find equations for $\Theta(A_{g,*})$,
- study the intersection $\Theta(A_{g,*}) \cap \mathbb{P}_\lambda$.
- Applications to Arithmetic and Geometry of Shimura varieties

The Abelian varieties

$$(B_0, L_0) := \text{Jac}(C), \quad C: y^2 = x^5 + 1$$

C is a genus 2 curve, B_0 is a ppav with automorphism

$$\phi : B_0 \longrightarrow B_0, \quad \phi = \phi_C^*, \quad \phi_C(x, y) = (\zeta x, y)$$

where ζ is a primitive 5-th root of unity ((B_0, L_0, ϕ) is unique).

(B_0, L_0, ϕ) is rigid. Consider the 4 dim ppav with automorphism

$$(A_0, L, \phi_k) := (B_0 \times B_0, L_0 \boxtimes L_0, \phi \times \phi^k).$$

Deformation space has dimension:

$$\dim (\text{Deformations } (A_0, L, \phi_k)) = \begin{cases} 1 & k = 2, 3, \\ 2 & k = 4. \end{cases}$$

ppav's

The Shimura
varieties

The Shimura curve
The Shimura
surface

The level structure $\ast=(2,4)$

Symmetric theta structure of level two, $(2, 4)$.

$$A_{g,4} \longrightarrow \underbrace{A_{g,(2,4)} \longrightarrow A_{g,2}}_{\text{group } (\mathbb{Z}/2\mathbb{Z})^{2g}} \longrightarrow A_g.$$

$\underbrace{\hspace{15em}}_{\text{group } G}$

There is a non-split exact sequence:

$$0 \longrightarrow (\mathbb{Z}/2\mathbb{Z})^{2g} \longrightarrow G \longrightarrow Sp(2g, \mathbb{F}_2) \longrightarrow 0.$$

$Sp(2g, \mathbb{F}_2)$ is generated by **transvections**: for $v \in \mathbb{F}_2^{2g}$

$$t_v : \mathbb{F}_2^{2g} \longrightarrow \mathbb{F}_2^{2g}, \quad w \longmapsto w + E(w, v)v,$$

$E : \mathbb{F}_2^{2g} \times \mathbb{F}_2^{2g} \rightarrow \mathbb{F}_2 = \mathbb{Z}/2\mathbb{Z}$ is the symplectic form.

The G -equivariant map $\Theta : A_{g,(2,4)} \longrightarrow \mathbb{P}^N$

The theta constants provide a natural G -equivariant map

$$\Theta : A_{g,(2,4)} \longrightarrow \mathbb{P}^N, \quad N + 1 = 2^g.$$

Over \mathbb{C} , the map Θ is induced by the map

$$\mathbb{H}_g \longrightarrow \mathbb{P}^N, \quad \tau \longmapsto (\dots : \Theta[\sigma](\tau) : \dots)_{\sigma \in (\mathbb{Z}/2\mathbb{Z})^g}$$

with theta constants

$$\Theta[\sigma](\tau) = \sum_{m \in \mathbb{Z}^g} e^{2\pi i t(m+\sigma/2)\tau(m+\sigma/2)}.$$

$\Theta(A_{g,(2,4)})$ is birationally isomorphic with $A_{g,(2,4)}$.

For $g = 2$: $\Theta(A_{2,(2,4)}) = \mathbb{P}^3 - \{30 \text{ lines}\}$.

Determine $M_g \in \text{Aut}(\mathbb{P}^N)$

Can easily find $M_g \in \text{Aut}(\mathbb{P}^N)$ for $g \in (\mathbb{Z}/2\mathbb{Z})^{2g} \subset G$.
("Heisenberg group action")

For any transvection $t_v \in \text{Sp}(2g, \mathbb{F}_2)$ can find $M_{t_v} \in \text{Aut}(\mathbb{P}^N)$
(M_{t_v} is a linear combination of I and M_v).

Hence can find M_g for any $g \in G$.

In case $g = 2$, $\text{Sp}(2g, \mathbb{F}_2) \cong S_6$ (symmetric group).
Transvections correspond to transpositions.

Can easily find element of order five $h \in G$ and
corresponding $M_h \in \text{Aut}(\mathbb{P}^3)$.

M_h has four fixed points in $\mathbb{P}^3 - \{30 \text{ lines}\} = \Theta(A_{2,(2,4)})$,
By unicity, each fixed point is a $[(B_0, L_0, \alpha)]$ and $h = \phi^*$.

The eigenspaces \mathbb{P}_λ in \mathbb{P}^{15} of $M_h^{(k)}$

Recall: $(A_0, L, \phi_k) = (B_0 \times B_0, L_0 \boxtimes L_0, \phi_k := \phi \times \phi^k)$,
 $M_{\phi^*} = M_h$.

There are natural identifications:

$$\mathbb{P}^3 = \mathbb{P}\mathbb{C}^4, \quad \mathbb{P}^{15} = \mathbb{P}(\mathbb{C}^4 \otimes \mathbb{C}^4), \quad \Theta(A_0) = \Theta(B_0) \otimes \Theta(B_0).$$

$$M_h^{(k)} := M_{\phi_k^*} = M_{\phi^* \times (\phi^k)^*} = M_h \otimes M_h^k.$$

Can thus easily find the eigenspaces $\mathbb{P}_\lambda \subset \mathbb{P}^{15}$ of $M_h^{(k)}$
which contain $\Theta(A_0)$,

$$\Theta(A_0) \in \mathbb{P}_\lambda, \quad \dim \mathbb{P}_\lambda = \begin{cases} 2 & k = 2, 3, \\ 3 & k = 4. \end{cases}$$

Hence $\Theta((A_{4,(2,4)})^{\phi_k^*})$ is of codimension one in \mathbb{P}_λ .

The Shimura
varieties

The Shimura curve

The Shimura
surface

The equations for $\Theta(A_{g,(2,4)})$

Classical (even) theta constants ($\epsilon, \epsilon' \in (\mathbb{Z}/2\mathbb{Z})^g$, $\epsilon \cdot \epsilon' = 0$):

$$\theta[\epsilon']^2 = \sum_{\sigma \in (\mathbb{Z}/2\mathbb{Z})^g} (-1)^{\sigma \cdot \epsilon'} \Theta[\sigma] \Theta[\sigma + \epsilon].$$

There are well-known relations between the even theta constants, for example:

$$\prod_{a,b \in (\mathbb{Z}/2\mathbb{Z})^2} \theta_{\begin{bmatrix} 0000 \\ 00ab \end{bmatrix}} - \prod_{a,b} \theta_{\begin{bmatrix} 0000 \\ 10ab \end{bmatrix}} - \prod_{a,b} \theta_{\begin{bmatrix} 1000 \\ 00ab \end{bmatrix}} - \prod_{a,b} \theta_{\begin{bmatrix} 1100 \\ 11ab \end{bmatrix}} = 0,$$

of the form $r_1 - r_2 - r_3 - r_4$. Get a relation between the squares and a polynomial F of degree 32:

$$0 = \prod_{\pm, \pm, \pm} (r_1 \pm r_2 \pm r_3 \pm r_4) = P(r_1^2, \dots, r_4^2) = F(\dots, \Theta[\sigma], \dots).$$

Introduction

The moduli spaces of ppav's

The Shimura varieties

The Shimura curve
The Shimura surface

The intersection $\Theta(A_{4,(2,4)}) \cap \mathbb{P}_\lambda$

Take two such polynomials F_1, F_2 ,
restrict them to the eigenspace \mathbb{P}_λ , find their GCD:

$$\overline{\Theta((A_{4,(2,4)})^{\phi_k^*})} = \begin{cases} \text{a conic in } \mathbb{P}^2 & k = 2, 3, \\ \text{a degree six surface in } \mathbb{P}^3 & k = 4. \end{cases}$$

Let $Q[\epsilon']$ be the quadric in \mathbb{P}^{15} such that

$$Q[\epsilon'] \cap \Theta(A_{4,(2,4)}) = \{\Theta(\tau) : \theta[\epsilon'](\tau) = 0\}.$$

The boundary lies in at least $28 + 72 = 100$ such quadrics.
The conic lies inside $\Theta((A_{4,(2,4)})^{\phi_k^*})$
(so we have a **compact Shimura curve**). The surface
meets the boundary in 5 points (**the cusps**).

Covers and the Schottky-Jung relation

$$\underbrace{A_{g,(2,4,8)} \longrightarrow A_{g,(4,8)} \longrightarrow A_{g,4} \longrightarrow A_{g,(2,4)}}_{\text{group } (\mathbb{Z}/2\mathbb{Z})^M}$$

Intermediate 2:1 covers of $\Theta(A_{g,(2,4)})$ are given by

$$Y^2 = \sum_{\sigma \in (\mathbb{Z}/2\mathbb{Z})^g} (-1)^{\sigma \cdot \epsilon'} X_\sigma X_{\sigma + \epsilon} \quad (\subset \mathbb{P}^{N+1}),$$

i.e. get **modular** covers branched over $Q[\epsilon'] \cap \Theta(A_{g,(2,4)})$.

The closure of the locus of **Jacobians** of genus 4 curves is:

$$\Theta(A_{g,(2,4)}) \cap (J = 0), \quad J = 2^4 \sum \theta[\epsilon']^{16} - \left(\sum \theta[\epsilon']^8 \right)^2,$$

viewed as polynomial of degree 16 in the $X_\sigma (= \Theta[\sigma])$.

Introduction

The moduli
spaces of
ppav's

The Shimura
varieties

The Shimura curve

The Shimura
surface

The Shimura curve lies inside the Jacobi locus.

It parametrizes the genus 4 curves with automorphism

$$C_\lambda : y^5 = x(x-1)(x-\lambda), \quad \psi(x, y) := (\zeta x, y),$$

the de Jong-Noot family. For $\lambda = 0, 1$ one has

$$J(C_\lambda) \cong B_0 \times B_0, \quad \psi^* = (\phi^*, (\phi^2)^*) = \phi_2^*.$$

The Shimura curve lies in one of the quadrics $Q[\frac{\epsilon}{\epsilon'}]$
(each C_λ has a ‘vanishing even thetanull’).

The remaining $136 - 1 = 135 = 5 \cdot 27$ quadrics intersect the curve in 12 points, corresponding to $B_0 \times B_0$ (with some level structure).

Parametrising the Shimura curve

Introduction

The moduli
spaces of
ppav's

The Shimura
varieties

The Shimura curve

The Shimura
surface

The Shimura curve (a conic) is isomorphic to \mathbb{P}^1 and

$$\Theta((A_{4,(2,4)})^{\phi_2^*}) \cap (U' \mathbb{Q}[\epsilon']) = \{0, \infty, \zeta^k, \alpha \zeta^k\}_{k=0, \dots, 4},$$

where $\alpha = \zeta^3 + \zeta^2 + 1$.

Jacobians of some of the modular covers decompose into products of elliptic curves with $j \in \mathbb{Q}, \mathbb{Q}(\sqrt{5})$.

Among the corresponding modular forms is (a twist of) a Hilbert modular form of parallel weight two and conductor $8\sqrt{5}$.

The moduli
spaces of
ppav's

The Shimura
varieties

The Shimura curve

The Shimura
surface

Another description of (A, L, ϕ) :

- $A = V/\Lambda$, $\Lambda \cong \mathbb{Z}[\zeta]^2$, $V = \Lambda \otimes_{\mathbb{Z}} \mathbb{R}$,
- $J : V \rightarrow V$ is the complex structure, $J^2 = -I$,
- $c_1(L) = E : \Lambda \times \Lambda \rightarrow \mathbb{Z}$, $E(x, y) = \text{trace}({}^t x H \bar{y})$.
 H is skew Hermitian: ${}^t H = -\bar{H} \in M_2(\mathbb{Q}(\zeta))$.
- $\phi_* x = \zeta x$ for all $x \in V$.

Compatibility: $J \in SU(H)(\mathbb{R})$, $SU(H) \cong D_1^\times$,
 D is a quaternion algebra with center $F = \mathbb{Q}(\sqrt{5})$.

$$F \otimes_{\mathbb{Q}} \mathbb{R} \cong \mathbb{R} \times \mathbb{R}, \quad \sqrt{5} \mapsto (\sqrt{5}, -\sqrt{5}),$$

$$D_1^\times(\mathbb{R}) \cong SU(2) \times SU(1, 1) \cong SU(2) \times SL(2, \mathbb{R}).$$

The Shimura curve is $\Gamma \backslash \mathbb{H}_1$, $\Gamma \subset \text{im}(D_1^\times(\mathbb{Z}) \rightarrow SL(2, \mathbb{R}))$.

Geometry of the Shimura surface

The Shimura surface has 5 cusps and has automorphism group S_5 (symmetric group). Equations (in a \mathbb{P}^4):

$$s_1 := x_1 + \dots + x_5 = 0, \quad s_2^3 + 10s_3^2 - 20s_2s_4 = 0.$$

Singular points: 5 cusps (orbit of p_0 , tgt cone: $xyz = 0$) and 24 nodes (orbit of q_0), corresponding to $B_0 \times B_0$:

$$p_0 := (-4 : 1 : 1 : 1 : 1), \quad q_0 := (1 : \zeta : \zeta^2 : \zeta^3 : \zeta^4).$$

Locus of Jacobians: a curve of degree $6 \cdot 16 = 96$,

- a curve of degree 24 (no vanishing thetanull) parametrises $y^5 = x^3(x-1)^2(x-\lambda)$.
- 12 curves of degree three (and multipl. 2) parametrising $y^5 = x^4(x^2 + \lambda x + 1)$, hyperelliptic curves (in 10 $Q[\epsilon']$'s), Weierstrass equation: $y^2 = (x^5 - 1)(x^5 - \mu_\lambda)$.

Canonical system: quadrics in \mathbb{P}^3 passing through the 5 cusps. There is an injective homomorphism $S_5 \hookrightarrow S_6$:

$$(1\ 2) \longmapsto (1\ 4)(2\ 3)(5\ 6), \quad (5\ 4\ 3\ 2\ 1) \longmapsto (2\ 6\ 5\ 4\ 3).$$

Equations for the canonical model of the Shimura surface (in a \mathbb{P}^5), a complete intersection of type $(3, 3)$:

$$z_1 + z_2 + z_3 + z_4 + z_5 + z_6, \quad z_1^3 + z_2^3 + z_3^3 + z_4^3 + z_5^3 + z_6^3,$$

and the following (alternating for S_5) cubic:

$$z_1 z_2 z_3 - z_1 z_2 z_4 - z_1 z_2 z_5 + \dots + z_3 z_5 z_6 - z_4 z_5 z_6.$$

S_5 has a unique irreducible representation on \mathbb{P}^5 , these are the 'unique' cubic invariants.

Numerical invariants of the minimal model \tilde{S} of the surface:

$$q = 0, \quad p_g = 5, \quad K^2 = 9, \quad \chi_{top} = 63, \quad h^{1,1} = 51, \quad \rho = 46.$$

The Hodge structure on H^2 splits:

$$H^2(\tilde{S}, \mathbb{Q}) = T \oplus_{\perp} S, \quad \begin{cases} T = V^5, & \dim V^{p,q} = 1, \quad \forall (p, q), \\ S^{2,0} = S^{0,2}, & \dim S^{1,1} = \rho. \end{cases}$$

The L-series of the Galois representation associated to V :

$$L(V, s) \stackrel{?}{=} L(\text{Sym}^2 H^1(E), s), \quad E: y^2 = x(x^2 + x - 1),$$

E is an elliptic curve with conductor 20, $j(E) = 16384/5$,
 E is also a modular double cover of the Shimura curve.

The Shimura surface is a Hilbert modular surface

Explicit moduli spaces of abelian varieties with automorphisms

Bert van Geemen
(joint work with Matthias Schütt)

Introduction

The moduli spaces of ppav's

The Shimura varieties

The Shimura curve

The Shimura surface

A Hilbert modular surface is the moduli space of abelian surfaces B such that

$$\text{End}(B) \otimes \mathbb{Q} \supset \mathbb{Q}(\sqrt{d}) \quad d > 0.$$

It is obtained as (with $\mathbb{Q}(\sqrt{d}) \hookrightarrow \mathbb{R} \times \mathbb{R}$ as before):

$$\Gamma \backslash (\mathbb{H}_1 \times \mathbb{H}_1), \quad \Gamma \subset SL_2(\mathbb{Q}(\sqrt{d})) \hookrightarrow SL_2(\mathbb{R}) \times SL_2(\mathbb{R}).$$

Any deformation of (A_0, L, ϕ_4) is isogeneous to B^2 , for an abelian surface B with $\mathbb{Q}(\sqrt{5}) \subset \text{End}(B) \otimes \mathbb{Q}$.

Thus the Shimura surface is dominated by a **Hilbert modular surface**.

Mumford Tate group: $SU(H) \cong SL_{2, \mathbb{Q}(\sqrt{5})}$.
