A surface is a projective compact complex manifold of dimension 2.

We look at surfaces modulo birational equivalence, the equivalence relation generated by the blow-up in a point.

The classical birational invariants are

- the geometric genus
 $p_g(S) = h^{2,0}(S) = h^0(\Omega_S^2) = h^0(\mathcal{O}_S(K_S)) = h^2(\mathcal{O}_S)$.
- the irregularity $q(S) = h^{1,0}(S) = h^0(\Omega_S^1) = h^1(\mathcal{O}_S)$.
- the Euler characteristic $\chi = \chi(\mathcal{O}_S) = 1 - q + p_g$.
- The plurigenera $P_n(S) = h^0(\mathcal{O}_S(nK_S))$.
- The Kodaira dimension $\kappa(S)$ is the rate of growth of the plurigenera: it is the smallest number κ such that P_n/n^κ is bounded from above.

Surfaces of general type

The Enriques-Kodaira classification provides a relatively good understanding of the surfaces of *special* type, which are those with $\kappa(S) < 2$.

Definition

A surface is *of general type* if $\kappa(S) = 2$ (equiv. $\kappa(S) \geq 2$).

Definition

A surface is *of general type* if $\kappa(S) = 2$ (equiv. $\kappa(S) \geq 2$).

Definition

A surface is *minimal* if K_S is *nef*, that is if the intersection of K_S with any curve is nonnegative.

In every birational class of surfaces of general type there is exactly one *minimal* surface. If S is a surface of general type, S is obtained by the only minimal surface \bar{S} in its birational class by a sequence of $K_S^2 - K_{\bar{S}}^2$ blow ups.

M. Noether conjecture

Beauville construction

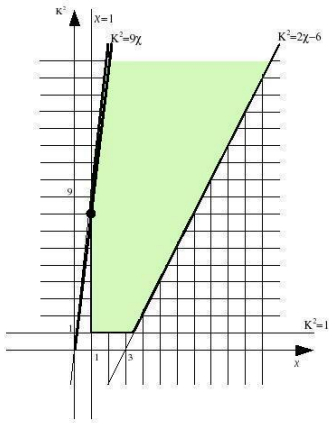

Beauville suggestion: take $S = (C_1 \times C_2)/G$ where C_i are Riemann Surfaces of genus $g_i \geq 2$ and G is a group of order $(g_1 - 1)(g_2 - 1)$ acting freely; S is automatically minimal of general type with $\chi = 1$ and $K^2 = 8$.

Surfaces isogenous to a product

A surface is isogenous to a (higher) product if $S = (C_1 \times C_2)/G$ where C_i are Riemann Surfaces of genus $g_i \geq 2$ and G is a group acting freely; S is automatically minimal of general type with $K^2 = 8\chi$.

- **What we lose:** X is singular, we need to consider a resolution of its singularities S .
- **What we gain:** It may be $K^2 < 8\chi$. We may in principle fill most of the picture.

Quasi-étale quotients

It may be $K^2 < 8\chi$. We may in principle fill most of the picture.

This gives a powerful tool to answer (positively) existence conjectures.

To construct an unmixed surface I need two curves with an action of the same group, so two systems of generators of the same group $G = G^{(0)}$.

In the mixed case, we only need one system of generators of $G^{(0)}$, and a degree 2 unsplit extension G of $G^{(0)}$.

From now on, we assume quasi-étaleness, running in parallel both the mixed and the unmixed case.

There is a simple formula for the irregularity:

$$\begin{cases} q(S) = g(C_1/G) + g(C_2/G) & \text{in the unmixed case} \\ q(S) = g(C/G^{(0)}) & \text{in the mixed case} \end{cases}$$

K^2 and χ

We know that

$$K_S^2 = \frac{8(g(C_1) - 1)(g(C_2) - 1)}{|G|} - \sum_{x \in \text{Sing}X} k_x$$

$$\chi = \frac{K_S^2}{8} + \sum_{x \in \text{Sing}X} b_x$$

where k_x and b_x are positive rational numbers depending only on the analytic type of the singularity which we know how to compute.

The algorithms

Reversing the above formulas we implemented in Magma an algorithm that computes all quasi-étale surfaces S with given p_g , q and K_S^2 .

- 1 find all (fin. many) possible pairs of genera $(g(C_1/G^{(0)}), g(C_2/G^{(0)}))$ and configurations ("baskets") of singularities with $\sum_x b_x = 8\chi - K_S^2$;
- 2 for every "basket" and pair of genera, list all (fin. many) "signatures" satisfying certain inequalities we proved;
- 3 to each (pair of) signature(s), Hurwitz formula predicts $|G^{(0)}|$: then search all groups of that order for sets of generators with the prescribed signatures;

We implemented the algorithm in MAGMA in the unmixed case for $p_g = 0$. Recall that if a surface of general type S is minimal, then K_S^2 is positive.

Theorem (Bauer, Catanese, Grunewald, -)

Unmixed quasi-étale surfaces of g. t. with $p_g = 0$ form

- 1 *exactly 13 irreducible families of surfaces for the case in which G acts freely: they form 13 irreducible connected components of the moduli space;*

We implemented the algorithm in MAGMA in the unmixed case for $p_g = 0$. Recall that if a surface of general type S is minimal, then K_S^2 is positive.

Theorem (Bauer, Catanese, Grunewald, -)

Unmixed quasi-étale surfaces of g. t. with $p_g = 0$ form

- 1** *exactly 13 irreducible families of surfaces for the case in which G acts freely: they form 13 irreducible connected components of the moduli space;*
- 2** *exactly 72 irreducible families of minimal surfaces;*

We implemented the algorithm in MAGMA in the unmixed case for $p_g = 0$. Recall that if a surface of general type S is minimal, then K_S^2 is positive.

Theorem (Bauer, Catanese, Grunewald, -)

Unmixed quasi-étale surfaces of g. t. with $p_g = 0$ form

- 1 *exactly 13 irreducible families of surfaces for the case in which G acts freely: they form 13 irreducible connected components of the moduli space;*
- 2 *exactly 72 irreducible families of minimal surfaces;*
- 3 *there is exactly one unmixed quasi-étale surface with $p_g = 0$ and $K_S^2 > 0$ which is not minimal.*

We implemented the algorithm in MAGMA in the unmixed case for $p_g = 0$. Recall that if a surface of general type S is minimal, then K_S^2 is positive.

Theorem (Bauer, Catanese, Grunewald, -)

Unmixed quasi-étale surfaces of g. t. with $p_g = 0$ form

- 1 *exactly 13 irreducible families of surfaces for the case in which G acts freely: they form 13 irreducible connected components of the moduli space;*
- 2 *exactly 72 irreducible families of minimal surfaces;*
- 3 *there is exactly one unmixed quasi-étale surface with $p_g = 0$ and $K_S^2 > 0$ which is not minimal.*

A similar classification for $p_g = q \geq 1$ has been obtained by Carnovale, Mistretta, Penegini, Polizzi, Zucconi.

In the mixed case the algorithm is implemented in the case $q = 0$.

Theorem (Bauer, Catanese, Grunewald, Frapporti)

Mixed quasi-étale surfaces of general type with $p_g = 0$ form

- 1 *exactly 5 irreducible families of surfaces for the case in which G acts freely: they form 5 irreducible connected components of the moduli space;*

In the mixed case the algorithm is implemented in the case $q = 0$.

Theorem (Bauer, Catanese, Grunewald, Frapporti)

Mixed quasi-étale surfaces of general type with $p_g = 0$ form

- 1** *exactly 5 irreducible families of surfaces for the case in which G acts freely: they form 5 irreducible connected components of the moduli space;*
- 2** *exactly 17 irreducible families of minimal surfaces;*

In the mixed case the algorithm is implemented in the case $q = 0$.

Theorem (Bauer, Catanese, Grunewald, Frapporti)

Mixed quasi-étale surfaces of general type with $p_g = 0$ form

- 1** *exactly 5 irreducible families of surfaces for the case in which G acts freely: they form 5 irreducible connected components of the moduli space;*
- 2** *exactly 17 irreducible families of minimal surfaces;*
- 3** *all mixed quasi-étale surface with $p_g = 0$ and $K_S^2 > 0$ are minimal.*

In the mixed case the algorithm is implemented in the case $q = 0$.

Theorem (Bauer, Catanese, Grunewald, Frapporti)

Mixed quasi-étale surfaces of general type with $p_g = 0$ form

- 1** *exactly 5 irreducible families of surfaces for the case in which G acts freely: they form 5 irreducible connected components of the moduli space;*
- 2** *exactly 17 irreducible families of minimal surfaces;*
- 3** *all mixed quasi-étale surface with $p_g = 0$ and $K_S^2 > 0$ are minimal.*

Similar results have been obtained by the same authors mentioned before for $p_g = q \geq 1$ only in the étale case.

Problem

How do we determine the minimal model of S ?

and, related to it

Problem

Can we find all quasi-étale surfaces of general type with $p_g = 0$, or, more generally, with given p_g and q ?

We need an explicit bound $K_S^2 \geq k(p_g, q)$. We need for that a better understanding of the rational curves on X .
